Veeam Backup & Replication Setup

### Service Account

Specify the account for Veeam Backup & Replication service.

☐ LOCAL SYSTEM account (recommended)

☒ The following user account:

 Type in the user name in the DOMAIN\USERNAME format. The specified user account must have local administrator privileges on this server.

User name:

Password:

Veeam Backup & Replication Setup

### SQL Server Instance

Choose SQL Server instance to create Veeam Backup & Replication databases on.

☒ Install new instance of SQL Server (localhost\VEEAMSQL2016)

☐ Use existing instance of SQL Server (HOSTNAME\INSTANCE)

Veeam Backup & Replication database:

Connect to SQL Server using

☒ Windows authentication credentials of service account

☐ SQL Server authentication using the Login ID and password below:

Login ID:

Password:

Veeam Backup & Replication Setup

### Port Configuration

Specify port configuration to be used by Veeam Backup & Replication.

Catalog service port:	9393
Veeam Backup service port:	9392
Secure connections port:	9401
RESTful API service port:	9419

< Back   Next >   Cancel

Veeam Backup & Replication Setup

### Data Locations

Specify the guest file system catalog (persistent data), and the instant recovery write cache (non-persistent data) storage locations.

#### Instant recovery write cache

Write cache folder:  
E:\ProgramData\Veeam\Backup\IRCache   Browse...

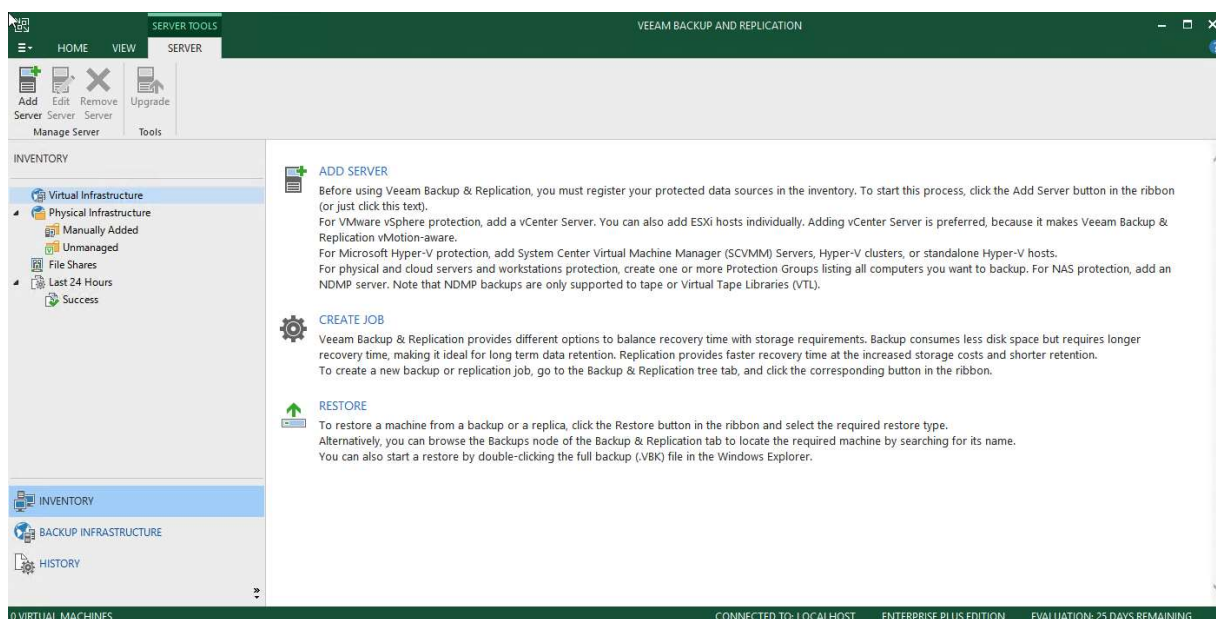

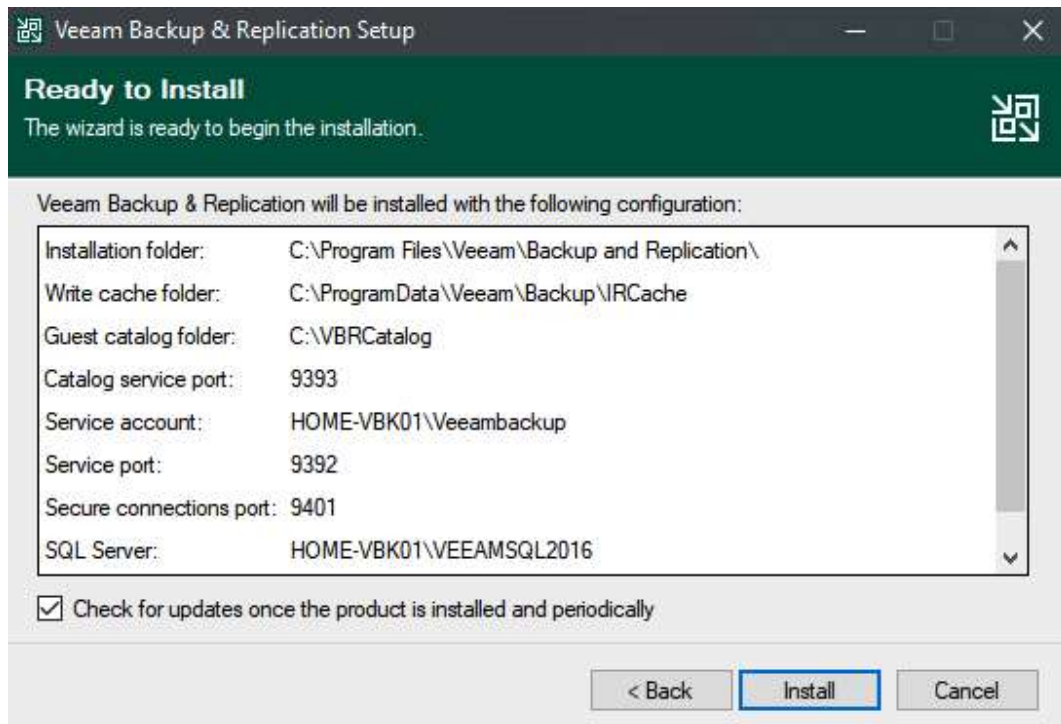

Ensure that the selected volume has sufficient free disk space to store changed disk blocks of instantly recovered VMs, otherwise VMs will stop due to being unable to perform a disk write. We recommend placing the write cache on an SSD drive.

#### Guest file system catalog

Catalog folder:  
E:\VBRCatalog   Browse...

< Back   Next >   Cancel

## VMware vSphere

Select the type of a VMware server you want to add to the inventory.

### vSphere

Adds vCenter Server (recommended), or standalone vSphere Hypervisor (ESXi) to the inventory.

### vCloud Director

Adds VMware vCloud Director server to the inventory.

## Add Backup Repository

Select the type of backup repository you want to add.

### Direct attached storage

Microsoft Windows or Linux server with internal or direct attached storage. This configuration enables data movers to run directly on the server, allowing for fastest performance.

### Network attached storage

Network share on a file server or a NAS device. When backing up to a remote share, we recommend that you select a gateway server located in the same site with the share.

### Deduplicating storage appliance

Dell EMC Data Domain, ExaGrid, HPE StoreOnce or Quantum DXi. If you are unable to meet the requirements of advanced integration via native appliance API, use the network attached storage option instead.

### Object storage

On-prem object storage system or a cloud object storage provider. Object storage can only be used as a Capacity Tier of scale-out backup repositories, backing up directly to object storage is not currently supported.

Backup   Maintenance   Storage   Notifications   vSphere   Integration   Scripts

Primary storage integration

☒ Enable backup from storage snapshots  
Use storage snapshots (instead of VM snapshots) as the data source for this job. Using storage snapshots reduces impact on the production environment from VM snapshot commit.

☐ Limit processed VM count per storage snapshot to 10  
By default, the job will process all included VMs located on the same datastore from a single storage snapshot.

☐ Failover to standard backup  
Perform standard backup from VM snapshot if backup from storage snapshot fails.

Save As Default   OK   Cancel

## Add Backup Repository

Select the type of backup repository you want to add.

### Direct attached storage

Microsoft Windows or Linux server with internal or direct attached storage. This configuration enables data movers to run directly on the server, allowing for fastest performance.

### Network attached storage

Network share on a file server or a NAS system. When backing up to a remote share, we recommend that you select a gateway server located in the same site with the share.

### Deduplicating storage appliance

Dell EMC Data Domain, ExaGrid, HPE StoreOnce or Quantum DXi. If you are unable to meet the requirements of advanced integration via native appliance API, use the network attached storage option instead.

### Object storage

On-prem object storage system or a cloud object storage provider. Object storage based repositories can only be used for Capacity Tier of scale-out backup repositories, backing up directly to object storage is not currently supported.

Cancel

## Direct Attached Storage

Select the operating system type of a server you want to use as a backup repository.

### Microsoft Windows

Adds local server storage presented as a regular volume or Storage Spaces. For better performance and storage efficiency, we recommend using ReFS.

### Linux

Adds local server storage, or locally mounted NFS share. The Linux server must use bash shell, and have SSH and Perl installed.

## New Backup Repository

### Repository

Type in path to the folder where backup files should be stored, and set repository load control options.

Name

Server

Repository

Mount Server

Review

Apply

Summary

#### Location

Path to folder:

/backups/backups/vbk02

Browse...

Capacity: <Unknown>

Populate

Free space: <Unknown>

☒ Use fast cloning on XFS volumes (recommended)

Reduces storage consumption and improves synthetic backup performance.

☒ Make recent backups immutable for: 7 days

Protects backups from modification or deletion by ransomware or hackers. GFS full backups are made immutable for the entire duration of their retention policy.

#### Load control

Running too many concurrent tasks against the repository may reduce overall performance, and cause I/O timeouts. Control storage device saturation with the following settings:

☒ Limit maximum concurrent tasks to: 4

☐ Limit read and write data rate to: 1 MB/s

Click Advanced to customize repository settings.

Advanced

< Previous

Next >

Finish

Cancel

Storage Compatibility Settings

☐
**Align backup file data blocks**

Allows to achieve better deduplication ratio on deduplicating storage devices leveraging constant block size deduplication. Increases the backup size when backing up to raw disk storage.

☐
**Decompress backup data blocks before storing**

VM data is compressed by backup proxy according to the backup job compression settings to minimize LAN traffic. Uncompressing the data before storing allows for achieving better deduplication ratio on most deduplicating storage appliances at the cost of backup performance.

☐
**This repository is backed by rotated hard drives**

Backup jobs pointing to this repository will tolerate the disappearance of previous backup files by creating new full backup, clean up backup files no longer under retention on the newly inserted hard drives, and track backup repository location across unintended drive letter changes.

☐
**Use per-VM backup files**

Per-VM backup files may improve performance with storage devices benefiting from multiple I/O streams. This is the recommended setting when backing up to deduplicating storage appliances.

OK
Cancel

New Backup Repository

**Mount Server**

Specify a server to mount backups to when performing advanced restores (file, application item and instant VM recoveries). Instant recoveries require a write cache folder to store changed disk blocks in.

Name
Server
Repository
Mount Server
Review
Apply
Summary

Mount server:
home-vbk01.home.lab (Backup server)
Add New...

Instant recovery write cache folder:
F:\ProgramData\Veeam\Backup\IRCach\
Browse...

Ensure that the selected volume has sufficient free disk space to store changed disk blocks of instantly recovered VMs. We recommend placing write cache on an SSD drive.

☒
Enable vPower NFS service on the mount server (recommended)
Ports...

Unlocks instant recovery of any backup (physical, virtual or cloud) to a VMware vSphere VM. vPower NFS service is not used for instant recovery to a Microsoft Hyper-V VM.

## Add Backup Repository

Select the type of backup repository you want to add.

### Direct attached storage

Microsoft Windows or Linux server with internal or direct attached storage. This configuration enables data movers to run directly on the server, allowing for fastest performance.

### Network attached storage

Network share on a file server or a NAS device. When backing up to a remote share, we recommend that you select a gateway server located in the same site with the share.

### Deduplicating storage appliance

Dell EMC Data Domain, ExaGrid, HPE StoreOnce or Quantum DXi. If you are unable to meet the requirements of advanced integration via native appliance API, use the network attached storage option instead.

### Object storage

On-prem object storage system or a cloud object storage provider. Object storage can only be used as a Capacity Tier of scale-out backup repositories, backing up directly to object storage is not currently supported.

Cancel

## Object Storage

Select the type of object storage you want to use as a backup repository.

### S3 Compatible

Adds an on-premises object storage system or a cloud object storage provider.

### Amazon S3

Adds Amazon cloud object storage. Amazon S3, Amazon S3 Glacier (including Deep Archive) and Amazon Snowball Edge are supported.

### Google Cloud Storage

Adds Google Cloud storage. Both Standard and Nearline storage classes are supported.

### IBM Cloud Object Storage

Adds IBM Cloud object storage. S3 compatible versions of both on-premises and IBM Cloud storage offerings are supported.

### Microsoft Azure Storage

Adds Microsoft Azure cloud object storage. Microsoft Azure Blob Storage, Microsoft Azure Archive Storage and Microsoft Azure Data Box are supported.

Cancel

## Amazon Cloud Storage Services

Select the type of Amazon storage you want to use as a backup repository.

### Amazon S3

Adds Amazon S3 storage. Both Standard and Infrequent Access (IA) storage classes are supported.

### Amazon S3 Glacier

Adds Amazon S3 Glacier storage. Both Amazon S3 Glacier and Glacier Deep Archive are supported.

### AWS Snowball Edge

Adds AWS Snowball Edge appliance to enable seeding of backups into Amazon S3 object storage.

Cancel

## New Object Storage Repository

**Capacity Tier**

Specify object storage to copy backups to for redundancy and DR purposes. Older backups can be moved to object storage completely to reduce long-term retention costs while preserving the ability to restore directly from offloaded backups.

Name

☒ Extend scale-out backup repository capacity with object storage:

Performance Tier

Amazon S3

Add...

Placement Policy

Define time windows when uploading to capacity tier is allowed

Window...

**Capacity Tier**☒ Copy backups to object storage as soon as they are created

Create additional copy of your backups for added redundancy by having all backups copied to the capacity tier as soon as they are created on the performance tier.

Archive Tier

☒ Move backups to object storage as they age out of the operational restore window

Reduce your long-term retention costs by moving older backups to object storage completely while preserving the ability to restore directly from offloaded backups.

Summary

Move backup files older than 2 days (your operational restore window)

Override...

☒ Encrypt data uploaded to object storage

**Archive Tier**

Specify object storage to archive your backup files to. This reduces your long-term retention costs, while increases restore time.

Name

☒ Archive GFS full backups to object storage:

Performance Tier

Amazon S3 Glacier - Deep Archive

Add...

Placement Policy

Archive GFS backups older than 2 days

Storage...

Capacity Tier

**Archive Tier**

Summary

## Storage Settings

☒ Store archived backups as standalone fulls

To reduce storage costs, we store each backup as a delta from the previous one. For the long-term archive reliability considerations, you may instead choose to store each backup as a standalone full, without any dependencies on previous backups.

☒ Archive backups only if the remaining retention time is above minimal storage period

Avoid processing costs and penalties associated with early data deletion by not archiving backups which will have to be deleted before the minimum storage period expires.

Minimum storage duration for the selected repository: 180 days

Max concurrent tasks:  
4

Transport Mode

Backup proxy transport mode:

☒ **Automatic selection**  
Data retrieval mode is selected automatically by analyzing backup proxy configuration and reachable VMFS and NFS datastores. Transport modes allowing for direct storage access will be used whenever possible.

☐ **Direct storage access**  
Data is retrieved directly from shared storage, without impacting production hosts. For block storage, backup proxy server must be connected into SAN fabric via hardware or software HBA, and have VMFS volumes mounted.

☐ **Virtual appliance**  
Data is retrieved directly from storage through hypervisor I/O stack by hot adding backed up virtual disks to a backup proxy VM. Datastores containing protected VMs must be connected to a host running backup proxy VM.

☐ **Network**  
Data is retrieved from storage through hypervisor network stack using NBD protocol over host management interface. This mode has no special setup requirements. Recommended for 10 Gb Ethernet or faster.

Options

☒ Failover to network mode if primary mode fails, or is unavailable

☐ Enable host to proxy traffic encryption in Network mode (NBDSSL)

OK Cancel

Full VM Restore

**Restore Mode**  
Specify whether selected VMs should be restored back to the original location, or to a new location or with different settings.

Virtual Machines

Restore Mode

Secure Restore

Reason

Summary

☒ **Restore to the original location**  
Quickly initiate the restore of selected VM to its original location, with the original name and settings. This option minimizes the chance of user input error.

☐ **Restore to a new location, or with different settings**  
Customize the restored VM location, and change its settings. The wizard will automatically populate all controls with the original VM settings as the defaults.

☐ **Staged restore**  
Run the selected VM directly from backup files in the isolated DataLab to make changes to the guest OS or applications prior to placing the VM into production environment.

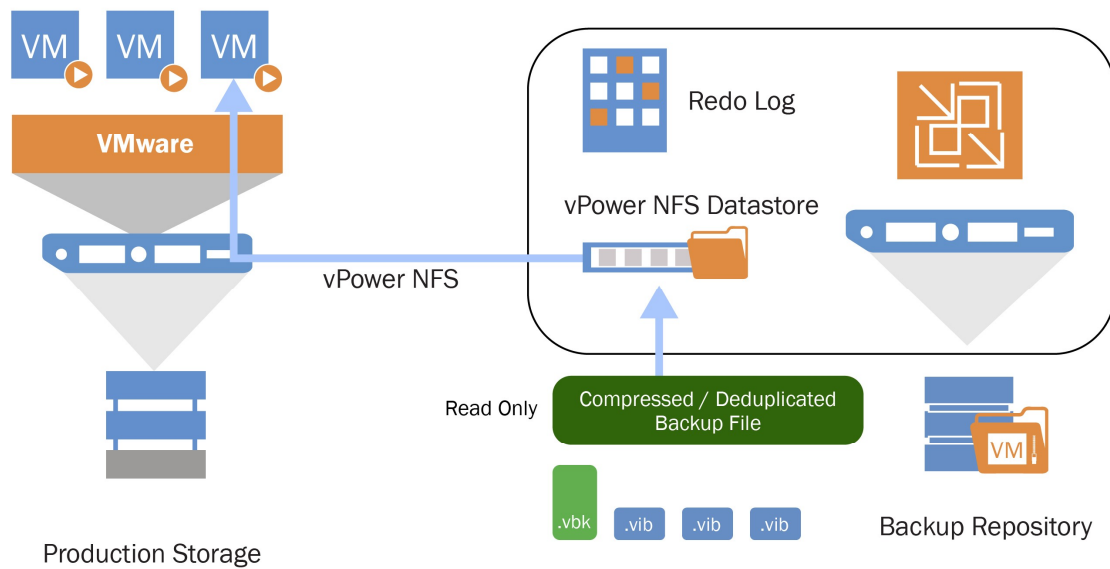

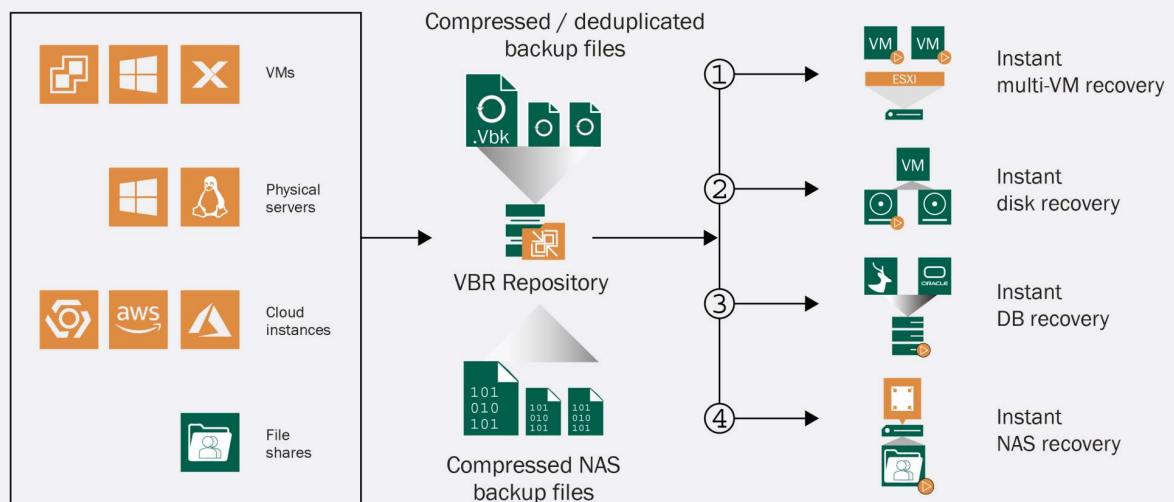

[Pick proxy to use](#)

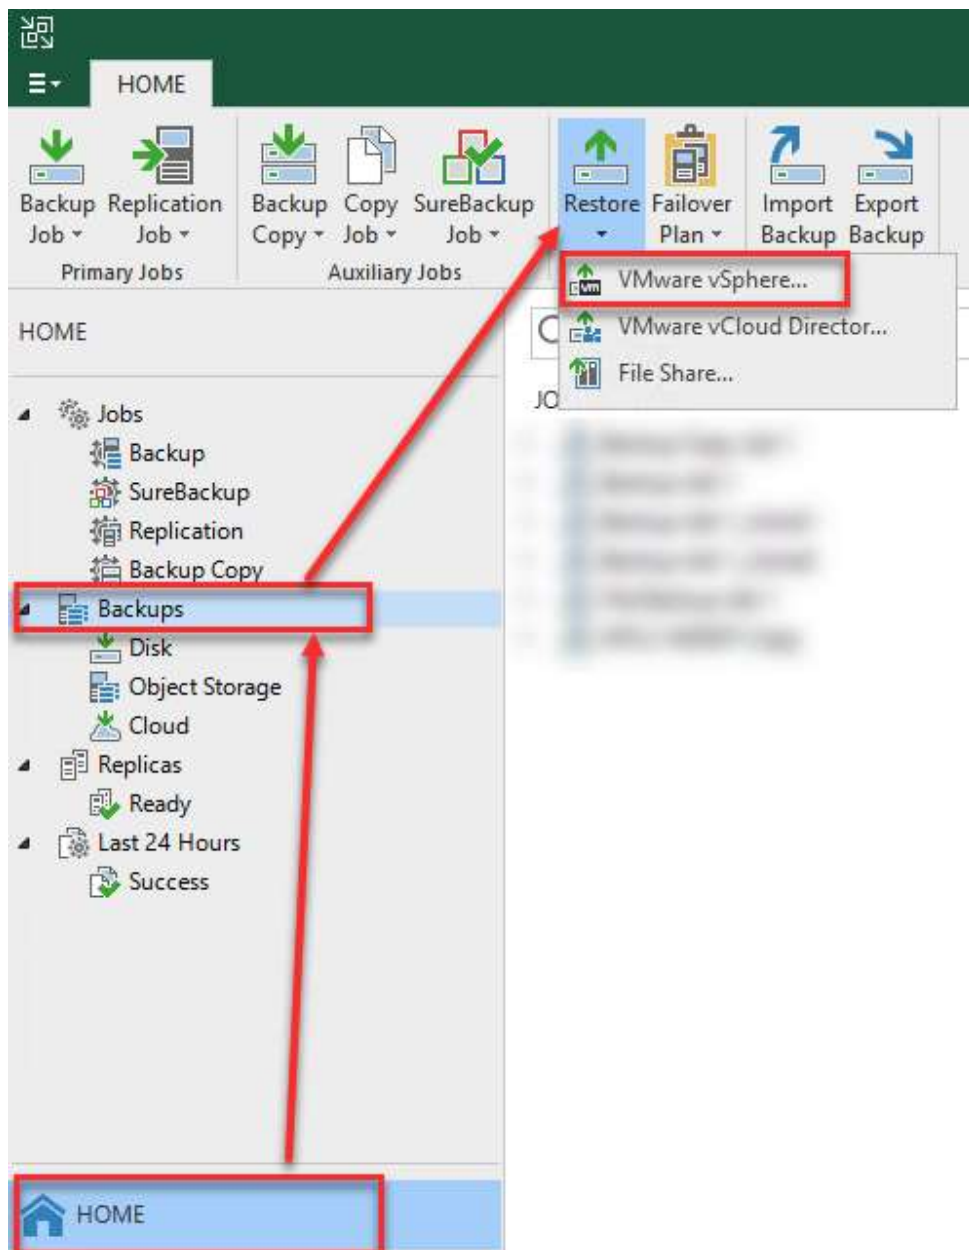

☒ **Quick rollback (restore changed blocks only)**  
Allows for quick VM recovery in case of guest OS software problem, or user error. Do not use this option when recovering from disaster caused by hardware or storage issue, or power loss.

## Chapter 8: Understanding Instant Recovery

### Instant Recovery by Veeam

## Restore

Choose whether you want to restore from backup or replica.

### Restore from backup

Performs restore from a backup file.

### Restore from replica

Performs restore from a replica VM.

Cancel

## Restore from Backup

Select the type of restore you want to perform.

### Entire VM restore

Restores the entire VM or its individual components, such as virtual disks.

### Volume restore

Restores the content of individual volumes.

### Guest files restore

Restores individual guest files from an image-level backup.

### Application items restore

Restores individual application items from an image-level backup.

Cancel

## Restore from Backup

Select the type of restore you want to perform.

Launches the Instant VM Recovery wizard

### Instant VM recovery

Instantly recovers a virtual machine by running it directly from backup. Remember to finalize the restore by moving the VM to your production storage.

### Entire VM restore

Restores entire VM to the original or a new location, and registers it with the vSphere infrastructure.

### VM files restore (VMX, NVRAM)

Restores individual VM files to the specified location.

### Restore to Amazon EC2

Restores any backup to the Amazon EC2 virtual machine, contains options for on-prem and cloud restores.

### Restore to Microsoft Azure

Restores any backup to the Microsoft Azure infrastructure as a service (IaaS) virtual machine, contains options for on-prem and cloud restores.

Reason

**Summary**

Summary:

VM: home-dc02, backed up 10 days ago (8:31 PM Friday 2020-12-18).  
Host: home-esxi02.home.lab  
Datastore: create on datastore "VM-Datastore2"  
New VM name: home-dc02-restored  
  
Secure Restore: Disabled

After you click Finish, the selected VM will be instantly recovered into your production environment. To finalize the recovery, use Storage VMotion to move running VM to the production storage. Alternatively, you can perform cold VM migration during your next maintenance window.

If you are performing manual recovery testing, remember to change VM network to non-production before powering on the VM.

☒ Connect VM to network  
☒ Power on target VM after restoring  

 Make sure original server is powered off. Recovering server into production network with original server still running may affect some applications.

Synchronize Credentials

VMware vCenter Server

Summary

Welcome to Veeam Disaster Recovery Orchestrator

This wizard will assist you with the initial configuration and set up of your orchestration environment.

Here you will add Orchestrator administrators, connect to VMware vCenter and Veeam Backup & Replication servers, and set other initial options.

To complete the initial configuration, you must provide a friendly name for the Orchestrator Server and add at least one active directory user to the Orchestrator Administrators role. The other steps in the wizard are optional - you may skip them and configure the required settings later in the Administration section of the Orchestrator UI. Note that if you cancel the wizard before completion, it will reopen the next time you log in to the Orchestrator UI.

Report Scheduling

Readiness Check

Summary

Define your Recovery Time Objective (RTO) and Recovery Point Objective (RPO) for this plan

Target RTO:

Hours:1

Minutes:0

Seconds:0

Maximum allowed time before the service is restored after a failure.

Target RPO:

Hours:0

Minutes:0

Seconds:15

Maximum allowed loss of historical data after a failure.
